

CAMPIONAMENTI

Nel periodo Luglio 2005 – Marzo 2007 (da Settembre 2005 a Villa San Lorenzo) sono stati effettuati campionamenti continuativi su base giornaliera (prelievi di 24 h) nelle due stazioni per la misura in massa (microgrammi/metro cubo) e la determinazione della composizione chimica del PM10 e del PM2.5 (PM2.5 raccolto per tutto il periodo a Villa San Lorenzo e solo nei mesi di Febbraio e Marzo 2007 a Fonte dei Seppi). Giornalmente, quindi, sono stati raccolti due filtri nella stazione di Villa San Lorenzo e un filtro (due filtri nel periodo Febbraio – Marzo 2007) a Fonte dei Seppi

Nella stazione di Villa San Lorenzo, inoltre, sono state condotte campagne a piu' corto periodo per la misura in continuo (risoluzione = 5 minuti), per laser-scattering (OPC – Optical Particle Counter), delle frazioni di particolato atmosferico da 16 a 0.3 micrometri, comprendenti le frazioni PM10, PM2.5 e PM1 (particolato di dimensioni rispettivamente inferiori a 10, 2.5 e 1 micrometri), e per la valutazione dello strato di rimescolamento atmosferico (PBL - Planetary Boundary Layer), attraverso misure della concentrazione di radon. Le misure di PBL hanno permesso di evidenziare che la maggior parte dei superamenti del limite di 50 mg/m³ del PM10 a Villa San Lorenzo hanno coinciso con periodi autunnali e invernali caratterizzati dalla formazione di strati di inversione termica (freddo al suolo, condizioni di alta pressione), che hanno comportato una scarsa circolazione atmosferica verticale (diminuzione dell'altezza dello strato di rimescolamento), causando anomale concentrazioni di inquinanti al suolo.

Nelle tabelle seguenti sono riportati i parametri essenziali di tutti i campionamenti condotti nelle due stazioni di prelievo. Nelle stesse tabelle sono anche riportati i valori delle concentrazioni atmosferiche del PM10 e del PM2.5 misurate sui filtri.

In totale sono stati effettuati 477 campionamenti di PM10 e 442 campionamenti di PM2.5 a Villa San Lorenzo e 473 campionamenti di PM10 e 45 campionamenti di PM2.5 a Monte Morello, per un totale di 1437 filtri raccolti ed analizzati.

Le interruzioni di campionamento che sono avvenute per periodi variabili da una settimana a circa un mese sono dovuti o alle necessarie operazioni di manutenzione e controllo della strumentazione o a malfunzionamenti dei campionatori (e conseguente invio alla ditta incaricata delle riparazioni).

Stazione: Sesto F.no Villa San Lorenzo PM 10
